Data inspector

Data Inspector compares the data in two SQL Server databases, and allows you to visualise those changes, create synchronisation scripts or deploy changes directly. Data can be filtered both through WHERE clauses at the data level, and by using the same schema based filters available in all Atlantis applications.

Data inspector really helps both with creating data migrations for end-user databases and investigation of replication issues. Data Inspector works in tandem with our Schema Inspector and both combine with our SQL Everywhere to make a uniquely **integrated** "one stop" solution for all SQL developers and administrators alike.

Data inspector uses a unique multi-threaded comparison engine to ensure that you get the most out of your investment in high speed networks and multi-core workstations.

Features include:

- Synchronisation, direct or by script
- Setting up comparison scenarios for repeatable deployments
- Full support for SQL Server 2000, 2005 & 2008

Advanced features:

- Multi-threaded comparison
- View differences in a natural grid format, side by side
- Advanced filtering allow objects and/or data to be quickly excluded / included from synchronisation, based on any criteria

Future features:

- Migration support
- Migration editor
- Migration runtime
- API Access

Editions Available

Professional	\$119
Personal	\$49
Community	\$0
