# SQL

## everywhere

**SQL Everywhere** eliminates many of the laborious parts of writing SQL: Refactoring, code completion, syntax highlighting, ability to run SQL on multiple databases, reformatting scripts and code snippet library are the main features of SQL Everywhere.

Its use speeds up database development and administration. The savings in development time make a significant contribution to ensuring that your project will deliver solutions on-time and on-budget.

### Features include:

- Database registration & grouping
  - This allows developers and DBAs to group multiple databases into groups, irrespective of what server they reside on. This allows developers to work on groups of databases by purpose, rather than servers.
  - Connectivity checking & alerting gives the user instant visual feedback on what databases are available.
- Context sensitive code completion
  - This provides object name & keyword suggestion where relevant, and also allows users to define shortcuts (e.g. 'ssf' -> 'SELECT \* FROM ').
  - This also allows developers to use Visual Studio-style code snippets to reduce repetitive typing tasks.
- Data editing
  - Edit data in-place using a familiar grid.
- Integrated object scripting and data scripting
  - Generate object scripts simply and easily by right clicking on the object in any view – even the editor!
- Code library
  - Save useful sections of code to the library for simple retrieval using the context menu.
- Process viewer
  - Keep tabs on what is running on your servers.

### Advanced features:

- Multiple Execution
  - Execute SQL on many databases at once, with the option to view all results in one grid.
- Code Generation
  - Generate .NET code to store any table object or result grid.
- Auditing
  - Save the SQL, results, error messages and data grids from every execution automatically.

### Editions Available

<b>Professional</b>	\$199
<b>Personal</b>	\$79
<b>Community</b>	\$0
